

Challenges of Session-aware Recommendation in E-Commerce

Dietmar Jannach
TU Dortmund, Germany
dietmar.jannach@tu-dortmund.de

About me

- ▶ Professor of Computer Science at TU Dortmund, Germany
- ▶ Co-founder of a tech company selling interactive selling solutions (2003-2008)
- ▶ Research interests
 - ▶ Recommender Systems
 - ▶ E-Commerce applications, business value of recommenders
 - ▶ Interactive advisory systems
 - ▶ Artificial Intelligence
 - ▶ Model-based Diagnosis, Constraints
 - ▶ Software Engineering
 - ▶ Debugging of Spreadsheets

Recommender Systems

- ▶ Automated recommendations
 - ▶ A pervasive part of our online user experience
 - ▶ Recommend us shopping items, movies, music, news, friends, jobs, groups or people to follow, restaurants, hotels...

Outline

- ▶ Why a common academic problem abstraction can be insufficient in practice
- ▶ Sequence-Aware Recommender Systems
- ▶ An e-commerce case study:
 - ▶ On short-term intents, reminders, trends and discounts
- ▶ Summary and outlook

Matrix Completion

- ▶ A familiar common problem abstraction in academia
- ▶ Given a matrix
 - ▶ where rows are users and columns are items, and
 - ▶ a number in a cell indicates a preference statement (e.g., ratings) of a user for a certain item
- ▶ Compute values for the missing cells

| | Item1 | Item2 | Item3 | Item4 | Item5 |
|-------|-------|-------|-------|-------|-------|
| Alice | 5 | ? | 4 | 4 | ? |
| User1 | 3 | 1 | ? | 3 | 3 |
| User2 | ? | 3 | ? | ? | 5 |
| User3 | 3 | ? | 1 | 5 | 4 |
| User4 | ? | 5 | 5 | ? | 1 |

Also familiar, but somehow
less researched

Session-aware recommendation

- ▶ Consider the user's most recent interests, their specific goals in their ongoing session, e.g.,
 - ▶ the **single item** that is currently looked at on an e-commerce shop
 - ▶ the **last five tracks** picked by the user on a music listening platform
 - ▶ the videos watched **last time** on a video streaming platform
- ▶ Optional:
 - ▶ Consider what is generally **trending** and popular
 - ▶ Recommend **on-sale** items (in e-commerce)

-
- ▶ Not covered by the matrix completion abstraction
 - ▶ Highly relevant in practice

It can be a complex problem

Minnow Sports Aluminum Baseball Bat For Baseball & Teeball

★★★★☆ 8 customer reviews

Price: \$29.99

Sale: \$19.99

You Save: \$10.00 (33%)

In Stock.

This item does not ship to **Germany**. Please check other sellers who may ship internationally. [Learn more](#)

Sold by **BBro Store** and **Fulfilled by Amazon**. Gift-wrap available.

Item Display Length:

32.0 inches

- Made from lightweight high grade Aluminum alloy for faster swing speed
- Ultra-thin 32" handle with All Sports grip for increased stability and accuracy
- Stylish design featuring full rolled-over end for ultimate performance
- Ideal for all levels of baseball players from practice to matches
- 32 inches in length & 24 ounces

Long- and short-term interests

- ▶ Being able to predict which kinds of things a certain user **generally** likes, is important
- ▶ However, assume you visit your favorite online shop, and here's what you looked at or purchased during the last weeks

- ▶ Now, you return to the shop and browse these items

What to recommend?

- ▶ Some plausible options

- ▶ Only shoes or only watches?
- ▶ Mostly Nike shoes?
- ▶ Maybe also some T-shirts?

- ▶ Using the matrix completion formulation

- ▶ One trains a model based only on past actions
- ▶ The context of the user's current shopping intent is considered only in "context-aware" recommenders
- ▶ Without the context:
 - ▶ The algorithm will probably most recommend only T-shirts and trousers
 - ▶ Might not be what you expect

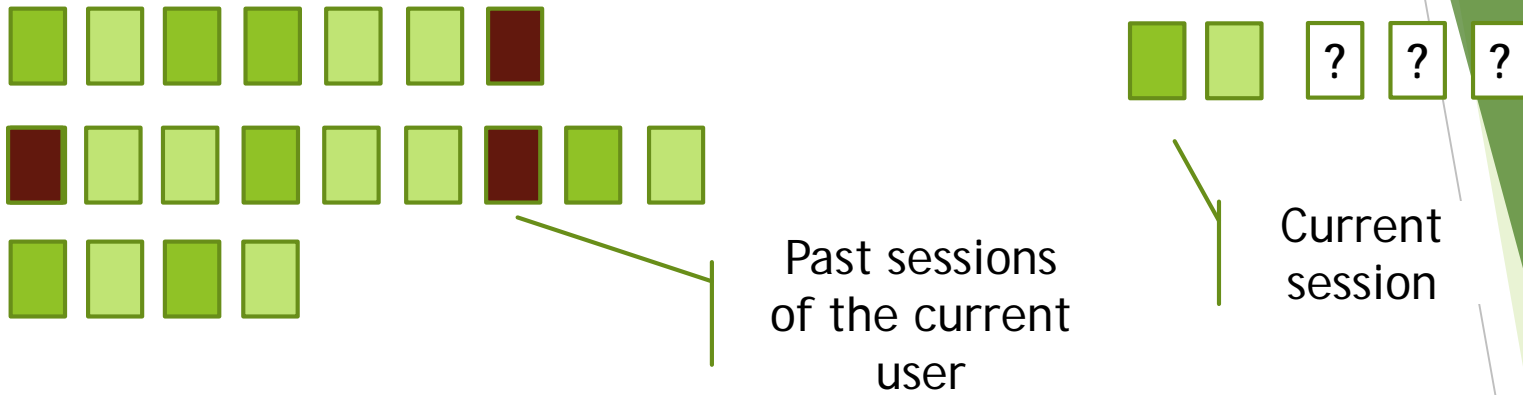

Outline

- ▶ Why a common academic problem abstraction can be insufficient in practice
- ▶ **Defining Sequence-Aware Recommender Systems**
- ▶ An e-commerce case study:
 - ▶ On short-term intents, reminders, trends and discounts
- ▶ Summary and outlook

Sequence-aware recommendation

- ▶ Requires a different problem abstraction
 - ▶ Has to consider the user's most recent actions
 - ▶ But may also utilize past preferences
- ▶ Is based on different types of information
 - ▶ A sequentially ordered set of past user actions
 - ▶ Actions can have different types
- ▶ Recommendation task
 - ▶ Combine long-term and short-term preference signals predict the next user action
 - ▶ Item view, purchase, add-to-cart, watch, listen
 - ▶ Sometimes, the order of the actions can be important

General problem situation

Past sessions of the user community

Categorization

- ▶ Introducing the family of “sequence-aware” recommender systems
 - ▶ Are based on time-ordered log data
 - ▶ Different main and supporting computational tasks, e.g.,
 - ▶ Context adaptation
 - ▶ Trend detection
 - ▶ Repeated recommendation
 - ▶ Consideration of ordering constraints
- ▶ Context adaptation subcategories
 - ▶ Last(-n) item based recommendation
 - ▶ Session-based recommendation (short-term only)
 - ▶ Session-aware recommendation (long-term, short-term, **our focus here**)

Existing technical approaches

- ▶ Mostly designed for context adaptation

- ▶ Sequence-learning techniques
 - ▶ Frequent pattern mining
 - ▶ Frequent item sets, frequent sequential patterns
 - ▶ Sequence modeling
 - ▶ Markov Models, Recurrent Neural Networks
 - ▶ Distributed item representations
 - ▶ Distributional and Latent Markov embeddings
- ▶ Sequence-aware matrix factorization
- ▶ Hybrids
 - ▶ Factorized Markov Chains, others

Outline

- ▶ Why a common academic problem abstraction can be insufficient in practice
- ▶ Defining Sequence-Aware Recommender Systems
- ▶ An e-commerce case study:
 - ▶ On **short-term intents**, reminders, trends and discounts
- ▶ Summary and outlook

On short-term intents

- ▶ Research question:
 - ▶ What is the **relative importance** of adapting recommendations to users' short-term intents (shopping goals) when they visit the site?
- ▶ Research approach:
 - ▶ "Hide-and-predict" simulation experiments on log data from a large online shop (Zalando)
 - ▶ Inputs
 - ▶ Behavior of larger user community (including current user)
 - ▶ Behavior of user in current session (first n actions)
 - ▶ Compare capability of session-aware and session-agnostic algorithms of predicting the purchased items in a given session

Technical approach

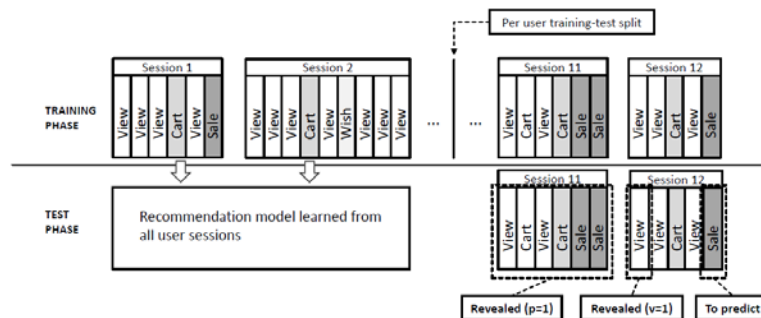

- ▶ Used a two-stage approach to compare session-aware and session agnostic algorithms
 - ▶ Stage 1: Learn a long-term user profile
 - ▶ Stage 2: Filter or re-rank items based on the assumed short-term situation or intents
- ▶ Stage 1 can be done offline
 - ▶ Various algorithms were tested
 - ▶ Bayesian Personalized Ranking, Factorization Machines, Item-item-Nearest-Neighbors, Popularity-based and Random Baselines
- ▶ Stage 2 must be “real-time”
 - ▶ Can still be based on complex models, e.g., Recurrent Neural Networks

Contextualization Strategies

- ▶ Various comparably simple strategies tested, e.g.,
 - ▶ CoOccur
 - ▶ “Customers who bought ... also bought”
 - ▶ Feature Matching (FM)
 - ▶ Rank items up when they have features in common with those from the current session (e.g., same brand)
 - ▶ Recently Viewed (RV)
 - ▶ Recommend recently viewed items in reverse chronological order
- ▶ Characteristics
 - ▶ All can be applied in real-time
 - ▶ Extend short lists with baseline recommendations

Empirical results, method

- ▶ No off-the-shelf standard protocol exists
 - ▶ e.g., in terms of forming training/test splits
 - ▶ Defined a parameterizable evaluation protocol
 - ▶ Define how much to reveal of the current and of previous sessions
 - ▶ Helps to understand how quickly different strategies are successful to adapt to the short-term goals
 - ▶ Hit rate (recall) and MRR as evaluation measures

Dataset

- ▶ Evaluations mostly based on an e-commerce log dataset
 - ▶ By Zalando, a major European online fashion retailer
 - ▶ Dataset contains sample of user activity logs
 - ▶ 1 million purchases
 - ▶ 20 million view events
 - ▶ 170,000 sessions
 - ▶ 800,000 users
 - ▶ 150,000 different items
- ▶ Dataset is very sparse
 - ▶ Many users without any purchase

Empirical results

- ▶ Observations for dense dataset (example)
 - ▶ Recall of best baseline method (BPR): 40%
 - ▶ Other:
 - ▶ Customers who bought ... : 49%
 - ▶ Just show me what I have seen : 64%
 - ▶ Show me similar things : 71%
 - ▶ Combining long- and short-term : 73%

Alternative session-based baselines

- ▶ C-KNN:
 - ▶ Take the current session and find n past sessions that are similar to the current one
 - ▶ Do sampling to ensure scalability
 - ▶ Performance is competitive with recent neural network approach
- ▶ Sequential Rules:
 - ▶ “Learn” rules of size two, i.e., count how often two items appeared together in a given sequence in past sessions
 - ▶ Apply discount for distance between events
 - ▶ Often even better than C-KNN

Jannach, D. and Ludewig, M.: *“When Recurrent Neural Networks meet the Neighborhood for Session-Based Recommendation”*. In: Proceedings of the 11th ACM Conference on Recommender Systems (RecSys 2017). Como, Italy

Kamehkhosh, I., Jannach, D. and Ludewig, M.: *“A Comparison of Frequent Pattern Techniques and a Deep Learning Method for Session-Based Recommendation”*. In: Proceedings of the ACM RecSys 2017 Workshop on Temporal Reasoning in User Modeling. Como, Italy,

Observations

- ▶ Combination of various short-term and long-term signals as the most effective strategy
- ▶ Choice of baseline is relevant
 - ▶ Better baseline in most cases leads to stronger overall results
- ▶ Importance of short-term adaptation
 - ▶ Contextualization-only methods often already better than the best long-term profile
 - ▶ Becomes more and more relevant, the more is known for the current session
 - ▶ Do the computational efforts of complex offline models truly pay off?
- ▶ **Reminding** is a very effective strategy

Outline

- ▶ Why a common academic problem abstraction can be insufficient in practice
- ▶ Defining Sequence-Aware Recommender Systems
- ▶ An e-commerce case study:
 - ▶ On short-term intents, **reminders**, trends and discounts
- ▶ Summary and outlook

More on reminders

- ▶ Follow-up study
 - ▶ Deeper analysis of reminders
 - ▶ Using again the Zalando dataset
 - ▶ Development of more intelligent reminding strategies
 - ▶ Evaluation of reminding strategy in field test

“Reco-minders” in practice

- ▶ Log data contains recommendation list for the view events
 - ▶ Every 10th recommendation was a reminder
 - ▶ More than 40% of the successful recommendations (recommendation clicks leading to purchases) were already known items
 - ▶ This also means that recommending unknown items is also very important, and helps users discover things
 - ▶ Users inspect an item multiple times before making a purchase
 - ▶ During one session, users inspect items of a small set of categories
 - ▶ Reminders as navigation shortcuts?

A field study on the business value

- ▶ A/B-tested different strategies on an e-commerce site for electronic gadgets
- ▶ Competing strategies
 - ▶ BPR as a learning-to-rank model
 - ▶ Similarity-based recommendation (using a reference item)
 - ▶ A personalized similarity-based approach
 - ▶ Popularity-based baseline
 - ▶ Present recently viewed items
 - ▶ In reverse chronological order

Field study outcomes

- ▶ “Success rate” as business measure
 - ▶ Click on recommendation and click on outgoing link to external retailer
 - ▶ Pure reminders led to best business value in this specific situation

Can we do better?

- ▶ Designed different “adaptive” reminding strategies
 - ▶ **Recency-based baseline**: Use reverse chronological order
 - ▶ **Intensity-based ranking**: Rank reminder items based on the number of past clicks
 - ▶ **Item-similarity ranking**: Select reminder items based on their fit for the current session
 - ▶ **Session-similarity ranking**: Select reminders based in their occurrence in similar past sessions
- ▶ General filtering strategy
 - ▶ Do not remind users of items in categories where recently a purchase was made

Empirical evaluation

- ▶ Baseline ranking method:
 - ▶ A session-based nearest neighbor technique
 - ▶ Configured to include reminders as well, more accurate than, e.g., BPR
- ▶ Results (hit rate, example, 2 evaluation variants)
 - ▶ v1 hides view event for target item, v2 reveals them

- ▶ Adaptive reminders better than simple reminders

Outline

- ▶ Why a common academic problem abstraction can be insufficient in practice
- ▶ Defining Sequence-Aware Recommender Systems
- ▶ An e-commerce case study:
 - ▶ On short-term intents, reminders, **trends and discounts**
- ▶ Summary and outlook

Recommendation success factors

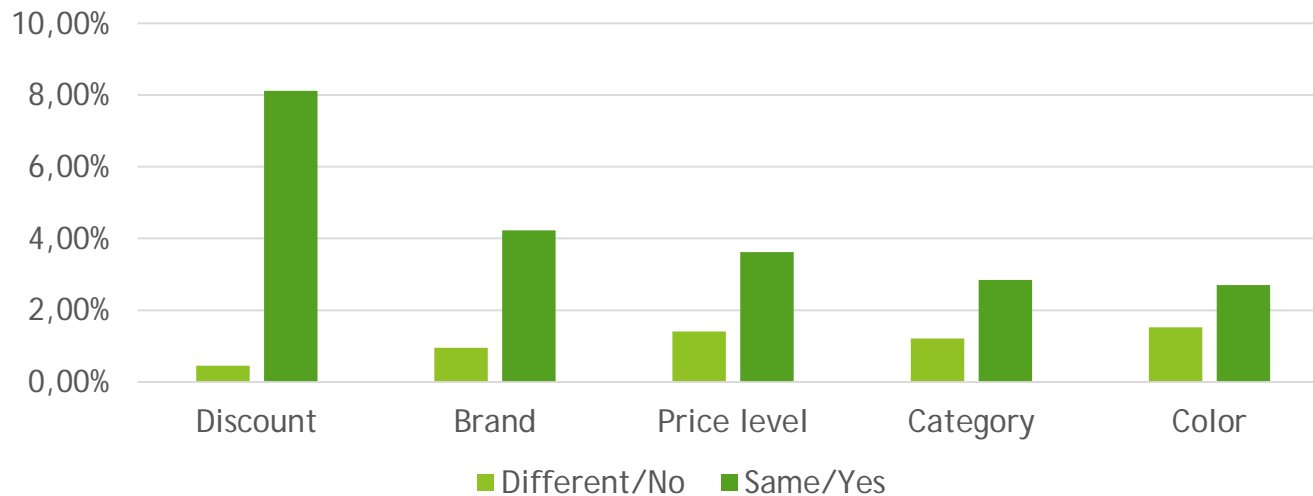

- ▶ Our dataset includes additional information:
 - ▶ For each view event, the three recommendations displayed on the item detail page
 - ▶ Click events on the recommended items
 - ▶ (Purchase information)
- ▶ Our research goal:
 - ▶ **Analyze** which recommendations are successful, i.e., lead to a purchase event later on
 - ▶ **Operationalize** these insights in new recommendation algorithms

Analysis results

- ▶ Reminders:
 - ▶ Only 10% of the recommendations seen before
 - ▶ But 44% of the successful ones were already known
- ▶ Short-term intents
 - ▶ Recommendations are more likely to be successful when from the same brand, category etc.
- ▶ Trends
 - ▶ Success rate of four times higher when the recommended item is trending on that day
- ▶ Discounts
 - ▶ Recommending on-sale items boosts the success rate

Analysis results

- ▶ Impact of item features on success of recommendations visualized
- ▶ About 1% success rate in general

Systematic feature analysis

- ▶ A more systematic approach
 - ▶ Engineered about 90 features to predict the success of a recommendation
 - ▶ Framed a classification problem
 - ▶ Determined the feature importance

| Feature | Gain Ratio | Chi Squared |
|---|------------|-------------|
| Discount level | 0.439 | 0.556 |
| Current popularity (day) | 0.371 | 1.000 |
| Discount flag | 0.325 | 0.556 |
| Viewed before | 0.286 | 0.435 |
| Current popularity (week) | 0.242 | 0.785 |
| Distance to first item view (in days) | 0.232 | 0.428 |
| Distance to last item view (in days) | 0.217 | 0.441 |
| Distance to first item view (in sessions) | 0.214 | 0.428 |
| Distance to last item view (in sessions) | 0.210 | 0.443 |
| Current popularity (month) | 0.201 | 0.563 |

Operationalization in algorithms

- ▶ **Approach 1:** A weighted two-phase approach
 - ▶ Create a candidate list of, e.g., 200 items using a baseline technique, in our case nearest-neighbors
 - ▶ Re-Rank items based on a weighted scoring scheme
 - ▶ Scoring functions
 - ▶ Content-wise similarity
 - ▶ Appearance in recent history (reminders)
 - ▶ Recent popularity on site
 - ▶ Level of discount
 - ▶ Importance weights have to be fine-tuned

Operationalization in algorithms

- ▶ **Approach 2: A classification based approach**
 - ▶ Framed scoring problem as a classification problem
 - ▶ Engineered 32 features in a similar way as was done for the feature importance analysis
 - ▶ Slightly different problem formulation
 - ▶ We are not interested analyzing success factors **in general**, but to predict the purchase probability **for the given session**
 - ▶ Used a deep neural-network approach for classification (H2O.ai library)
 - ▶ Outperformed Random Forests and manually tuned weights

Top features

| | |
|------------------------|--|
| Popularity | Normalized popularity of the item in the same day, week, or month |
| Viewed before | True, if the item was viewed before by the user |
| Views count | Number of previous views of the item by the user |
| Distance to first view | Distance to the first item view by the user in days or sessions |
| Distance to last view | Distance to the last view of the item in days or sessions |
| Brand ratio | Fraction of items of the same brand in the last 1, 2, and 3 sessions |
| Brand popularity | Overall popularity of the brand for the same day, week, or month |
| Color ratio | Fraction of items with the same color in the last 1, 2, and 3 sessions |
| Color popularity | Overall popularity of the color for the same day, week, or month |
| Category ratio | Fraction of items of the same category in the last 1, 2, and 3 sessions |
| Category popularity | Overall popularity of the category for the same day, week, or month |
| Price level ratio | Fraction of items of the same price level in the last 1, 2, and 3 sessions |
| Discount granted? | True, if the item is discounted |
| Discount level | Level of discount from 0 (no discount) to 3 (high discount) |

Results

- ▶ Deep Learning based method led to best results
 - ▶ Independent of the chosen baseline ranking technique
- ▶ Random Forests were not better than the manually tuned weighted hybrid

| Baseline Metric@10 | C-KNN | | C-CoOcc | | BPR | |

General insights

- ▶ First approach in academia to “reconstruct” success factors of recommendations from log data
- ▶ Could successfully operationalize the insights in a new prediction method
- ▶ Feature engineering is important
- ▶ Domain-dependent aspects should be considered
 - ▶ Reminding or not
 - ▶ Recommending discounted items or not
 - ▶ Recommending trending items or not

Outline

- ▶ Why a common academic problem abstraction can be insufficient in practice
- ▶ Defining Sequence-Aware Recommender Systems
- ▶ An e-commerce case study:
 - ▶ On short-term intents, reminders, trends and discounts
- ▶ Summary and outlook

Summary & Outlook

- ▶ Session-based recommendations relevant in many domains
- ▶ They require a different problem abstraction and evaluation methodology
- ▶ Recently, more awareness in the research community
 - ▶ e.g., using deep neural networks for next-item prediction
- ▶ Particularities in the e-commerce domain
 - ▶ E.g., considering discounts
- ▶ More general aspects (e.g., also for music recommendation)
 - ▶ E.g., considering trends, repeated recommendations

Outlook

- ▶ Perform additional experiments in different domains
 - ▶ Only partially validated so far
- ▶ Investigating the user perception of next-item recommendations
 - ▶ Recently made a study in the music domain
- ▶ Practical aspects
 - ▶ Assessing the business value of different algorithms
 - ▶ Assess the utility of complex models
 - ▶ See short paper in main program
- ▶ Academic aspects
 - ▶ Need for standardized problem abstraction and protocols for reproducibility

- ▶ Thank you for your attention
- ▶ Contact:
 - ▶ dietmar.jannach@tu-dortmund.de
